BONE MARROW INTERPRETATION

Electronically Signed Out: Kai Zhang, M.D. - GMC Lab

Bone marrow aspirate, trephine biopsy, and clot section: Acute myeloid leukemia with myelodysplasia-related changes.

Clinical History

History of myelodysplastic syndrome

Microscopic Findings

blood film

BM aspirate

BM core biopsy

	Peripheral Blood (%)	Bone Marrow (%)	Reference Range (%)
Myeloblasts	27	55	0-5
Promyelocytes		0	1-8
Myelocytes		5	5-20
Metamyelocytes	6	5	13-32
Band neutrophils	13	5	6-30
Segmented neutrophils	0	0	7-30
Segmented eosinophils	2	15	0-4
Segmented basophils	4	0	0-1
Nucleated RBCs		10	15-36
Lymphoblasts		10	0-1
Lymphocytes	33	2	3-24
Monoblasts		1	0-1
Monocytes	15	1	0-3
Plasma cells		1	0-2

CBC	
WBC	8.3 $10^3/\mu\text{L}$
RBC	3.1 $10^{12}/\text{L}$
HGB	9.9 g/dL
HCT	28.4 %
MCV	90.5 fl
MCH	31.5 pg
MCHC	34.8 g/dL
RDW	17.6 %
PLT	30.1 $10^3/\mu\text{L}$
RETIC	1.0 %

PERIPHERAL BLOOD: Normochromic and normocytic anemia is observed. Some anisocytosis is present. Leukemic blasts are noted, comprising approximately 27% of leukocytes. The blasts are medium to large sized cells with finely dispersed nuclear chromatin with one prominent nucleolus, scant amount of cytoplasm containing rare granules. Auer

Photographic images and diagrams represent key findings in this case; they are not intended to replace a complete review of the final diagnostic report.

The following statement applies to Flow Cytometry, Immunohistochemistry, Molecular Genetics, Immunofluorescence, and In situ Hybridization Assays: This test was developed and its performance characteristics determined by Geisinger Medical Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. The FDA has determined that such clearance or approval is not necessary. This test is used for clinical purposes. It should not be regarded as investigational or for research.

Rods are not observed. No monocytosis is present. Lymphocytes are normal. Platelets are decreased with occasional large ones; no platelet clumps are seen.

BONE MARROW ASPIRATE: The aspiration slides are hypercellular. Megakaryocytes are decreased with normal morphology. Numerous leukemic blasts are present, comprising approximately 55% of nucleated marrow cells. The morphologic features of the blasts are similar to the features of leukemic blasts of the peripheral blood. Dysgranulopoiesis is observed with left shift. Some dyspoietic granulocytes show hypo-granulation and hyposegmentation. Also present is evidence of mild dyserythropoiesis. Monocytes and lymphocytes are normal. No basophilia or eosinophilia is seen.

IRON STATUS: Iron store is increased. Many ringed sideroblasts are present, comprising approximately 45% of nucleated red blood cells.

BONE MARROW BIOPSY and CLOT SECTION: The core biopsy sample measures 2.8 cm. in length. It is markedly hypercellular (approximately 100%) for the patient's age. Sheets of leukemic blasts replace the marrow space. Megakaryocytes are decreased. There are a few scattered dyspoietic granulocytes and erythroid precursors. No evidence of lymphoid or epithelial infiltrates is seen. Clot section reveals similar morphologic alterations.
